Set business names, fuzzy matching, visibility, and how columns are compared

Analyst tab: column business names, fuzzy matching & visibility

Registering a table exposes all of its columns to officers. Use the table to give individual columns a business name, mark them fuzzy-matchable, or hide them. Columns with no entry here stay visible and fall back to an auto-derived label and a name-suggesting guess for fuzzy matching – which is exactly what Detecte reverts a column to.

Compare as only matches when a match puts this column against one of a different type – an account number stored in a table and a date in another. SBSE casts the pair rather than letting the query fix. Auto compares such as pairs as numbers (so 613 still matches 123), and setting Text on either side forces the two readings instead. Two columns of the same type are unaffected.

Register column metadata

– effect registered table –

Auto

☐ Fuzzy matches ☒ Visible to officers

Business name (e.g. account) Compare as

On we put any of the IP and URL in Host on Data Source Connection page.

Data Sources

Connect external databases and browse their catalogs, schemas, tables, views, and columns

Data sources

Connections are available only to Super Admins

- The option to give the limit of records/rows to show/extract from DB must be there like Limit 10 or anything else.
- Currently tool is supporting only select query. It should be support query for records count functionality as well.
- Sql query is not appearing for preview before running it.
- Once we get records and Report Analysis is selected, Again Extract Records becomes blank
